editing your website **gosscounselling.co.uk**

Preliminary edition, August 2026

Contents

1. Setting up a GitHub account	3
2. Signing in to the editor	4
3. What you will see	4
4. Making a change.....	6
5. Undoing something	6
6. Pictures.....	8
7. Writing a post.....	9
8. Things worth knowing	9
9. Editing from your phone.....	9
10. If something looks wrong.....	10
Still to come	10

Before you start

Your website has an editor built into it. You sign in, you get a form with your own words already in it, and when you save, the site rebuilds itself. The change is live a couple of minutes later.

There is no HTML, nothing to install, and nothing you can break by typing in the wrong box.

You need two things: a **GitHub account**, which is free and takes about two minutes, and the **address of the editor**, which is your site's address with /admin on the end.

1. Setting up a GitHub account

GitHub is the service that stores your site's words and pictures. It is what you sign in to the editor with, and it is the only account involved.

1. Go to **github.com** and choose **Sign up**.
2. Enter your email address. Use one you will still have in five years — the one you use for the practice is fine.
3. Choose a password. Write it down somewhere safe, or let your phone save it.
4. Choose a username. It is not shown on your website; it is only how GitHub knows you. Something plain is best.
5. GitHub emails you a code. Type it in.
6. When it asks what you want to do, you can skip every question. None of it affects you.
7. **Turn on two-factor authentication** when GitHub asks. It means a stolen password alone cannot get anyone in. The simplest option is a code sent to your phone. Another minute, and you will not think about it again.
8. **Send me your username.** This is the step everything else waits on, so do it before you close the page.

That last one matters more than it sounds. Your account exists, but it has nothing to do with your website until I connect the two — and I connect them by username. Until I have it you can sign in to the editor perfectly well and find nothing there to edit.

Where to find it: click your picture in the top right corner of github.com. Your username is at the top of the menu, under "Signed in as". It is the short name you chose in step 4, not your email address.

Send it to me however suits — text, WhatsApp, email. One word is enough.

2. Signing in to the editor

Go to your site's address with /admin on the end, and choose **Sign In with GitHub**.

The first time, GitHub asks whether you want to let the editor act on your behalf. Say yes. It will not ask again on that device.

If you are ever signed out, it is the same three steps.

3. What you will see

The editor has four sections down the left.

Home — your front page, one section at a time, in the order someone scrolls through them:

- Hero
- What happens when you get in touch
- How I can help
- About me
- Fees
- Qualifications and membership
- Questions people ask
- Get in touch

Changing your fees means opening **Fees**, not scrolling past everything else you have written. "Hero" is the trade's word for the dark band at the very top; the rest say what they are.

Services — one entry for each thing you offer. Each can have a longer page of its own, and only gets one if you write it.

General — the things that appear in more than one place:

- Contact details
- Testimonials
- Social profiles
- Membership and registration
- Site
- Search engines and sharing
- Wording on buttons and labels

Your number and email live in **Contact details**, and everything that links to you is built from them.

Blog — your posts. It can be empty, and it is empty until you write one. Until then there is no blog on the site at all — no link, no page.

Clicking one opens it. Every box is labelled, and most have a line underneath saying what the box is for.

The screenshot shows a web editor interface. At the top, there is a breadcrumb trail: < Home > How I can help. To the right of the breadcrumb is a vertical ellipsis icon and a 'Save' button. The main editing area is divided into four sections, each with a label and a vertical ellipsis icon to its right:

- Edit**: Below this label is a text input field containing 'What I offer'.
- Small label above the heading ***: Below this label is a text input field containing 'How I can help'.
- Heading ***: Below this label is a text input field containing 'How I can help'.
- Menu wording**: Below this label is a text input field containing 'How I can help'. Below the input field is a small note: 'Its name in the top menu. Keep it short. Empty uses "How I can help".'
- Line under the heading ***: Below this label is a text input field containing the text: 'Therapy, and your reasons for thinking about coming to see me, will be unique to you. These are the four ways I usually work.'

On the right side of the editor, there is a vertical toolbar with three icons: a checkmark, a circular arrow (undo), and a document icon.

4. Making a change

1. Click the section you want.
2. Change the words.
3. Click **Save**, top right.

This screenshot shows the top portion of the web editor interface. It includes the breadcrumb trail: < Home > How I can help. To the right of the breadcrumb is a vertical ellipsis icon and a 'Save' button.

That is all of it. A minute or two later the live site has caught up.

You do not have to finish. Save whenever you like; a half-written sentence is only a half-written sentence, and you can come back to it.

5. Undoing something

Nothing you do here is destructive. There are three ways back, and which one you want depends on one thing only: **whether you have pressed Save yet.**

Before you save

Every box has a : beside it. Open it and choose **Revert Changes** and that box goes back to what it was, leaving everything else alone.

← Home > How I can help

Save

Edit

Small label above the heading *

What I offer

Heading *

How I can help you

Revert Changes

Menu wording

How I can help

Its name in the top menu. Keep it short. Empty uses "How I can help".

Line under the heading *

Therapy, and your reasons for thinking about coming to see me, will be unique to you. These are the four ways I usually work.

The ⋮ at the top of the form has **Revert All Changes**, which does the same for the whole section at once.

Nothing has left your browser at this point. The website has not changed and nobody has seen anything.

Save is the line

Until you press Save, your website is exactly as it was. After you press Save, the change is recorded and the site rebuilds.

That is the whole difference between the two kinds of undo. **Revert** is for a change you have not saved. **History** is for one you have.

After you save

The clock icon on the right of a section shows every saved version of it, who saved it and when.

← Home > How I can help

Save

Edit

Small label above the heading *

What I offer

Heading *

How I can help

Menu wording

How I can help

Its name in the top menu. Keep it short. Empty uses "How I can help".

Line under the heading *

Therapy, and your reasons for thinking about coming to see me, will be unique to you. These are the four ways I usually work.

History

Ole Kristensen
Aug 6, 2026, 10:22 AM

Nothing is ever thrown away, so a change you regret an hour later, or a month later, is still there to go back to. If you want a version restored, tell me which one and when — that is a two-minute job and there is no way to lose the wrong thing doing it.

If you close the editor mid-edit

Unsaved changes are kept in your own browser, not on the website. Next time you open that section the editor will notice them and ask whether you want to **restore** them or **discard** them.

- **Restore** puts your half-finished edit back so you can carry on.
- **Discard** throws it away and gives you the section as it is published.

Neither answer can hurt anything: the published site was never touched either way. And if you answer on a different computer, or a different browser, there will be nothing to ask about — those unsaved changes live only where you made them.

6. Pictures

Anywhere the editor asks for a picture, it is optional and it works the same way: click, choose a file from your computer or phone, save.

Pictures are made smaller automatically. A photograph straight off your phone is fine — you do not need to shrink it first.

Your photograph — the field is in **Home → Hero** — is the one exception worth understanding. The site cuts you out of it and places you on the blue circle. A plain, evenly lit background works best — a wall, a plain backdrop, anything without much going on behind you. If a photographer gives you a picture that is already cut out, with no background at all, the site uses it as it is.

Every picture asks for a description. It is read aloud to anyone who cannot see the picture, and it is a few words, not a sentence: "John in his consulting room". If the picture is only decoration and says nothing the words do not, leave it empty.

All Assets, and why to leave it alone

The picture icon at the very top left opens **All Assets** — every file on your site in one list.

It is worth knowing it exists, and it is the wrong place to work.

Look at that list. Three of those are photographs of you, with names that mean nothing: john-about.webp, john-cutout.webp, john-goss.webp. One is the picture you uploaded, one is what the site made from it for the top of the page, and one is the photograph further down. Nothing on the screen tells you which is which, and there is a **Delete** button on the same bar.

So change pictures through the forms instead. Open **Home → Hero** and you can see the photograph sitting in the field it belongs to, with its own label, and replacing it there replaces exactly that one. The picture is shown next to the words it goes with, which is the thing All Assets cannot do.

Use All Assets to look. Use the forms to change.

7. Writing a post

Blog → New Post. The form asks, in this order:

- **Title.**
- **Status** — a draft is not built into the site at all. There is no page for it and nothing to find. Set it to Published when you are ready.
- **Publish on** — a date in the future means the post appears by itself at that moment. You do not have to be there.
- **Summary** — two or three lines. This is what shows in the list of posts.
- **Picture** and **Picture description** — both optional. See chapter 6.
- **Body** — write it. Use **Heading 2** to break a long post into parts, and **Heading 3** underneath those.
- **Search engine summary** — leave it alone. Empty, it uses the post's own title and summary, which is usually right.

8. Things worth knowing

Your number and your email are written down once. They live in **General → Contact details**, and every Call button, every email link and the WhatsApp link are built from them. Change the number there and it changes everywhere.

Some boxes want {phone} or {mailto} rather than the thing itself. Where you see that, leave it. It is how the site fills in your number without you having to keep two copies of it in step.

The second button at the top of the page always opens an email, whatever you write on it. So word it as an invitation to write to you.

The menu at the top follows your headings. Each section has a *Menu wording* box; leave it empty and it uses the heading.

9. Editing from your phone

The editor works on a phone, and there is a shortcut so you do not have to type a password into a small keyboard.

On the computer, click your picture in the top right and choose **Sign In with Mobile**. A square black-and-white code appears. Point your phone's camera at it and the phone opens the editor already signed in.

That code is a key to your website for as long as it is on screen. Do not photograph it, do not send it to anyone, and close it once your phone has read it. If someone else is in the room, it can wait.

Sign out when you have finished, every time — on the phone especially. Same menu, **Sign Out** at the bottom. A phone gets lent, left on a table, and looked at over a shoulder far more than a computer does, and a signed-in editor is the keys to your website. Signing back in is three taps.

10. If something looks wrong

Give it five minutes — a save takes a couple of minutes to reach the live site, and browsers hold on to old pages.

Then ring or write to me. Tell me what you changed and what it looks like. Nothing you can do in the editor is unrecoverable, so there is no hurry and nothing to be careful about.

Still to come

This is a preliminary edition, written before the site went live. Two things will be filled in once they are settled:

- **The live address**, and whether saving publishes straight to it or whether there is a step in between.
